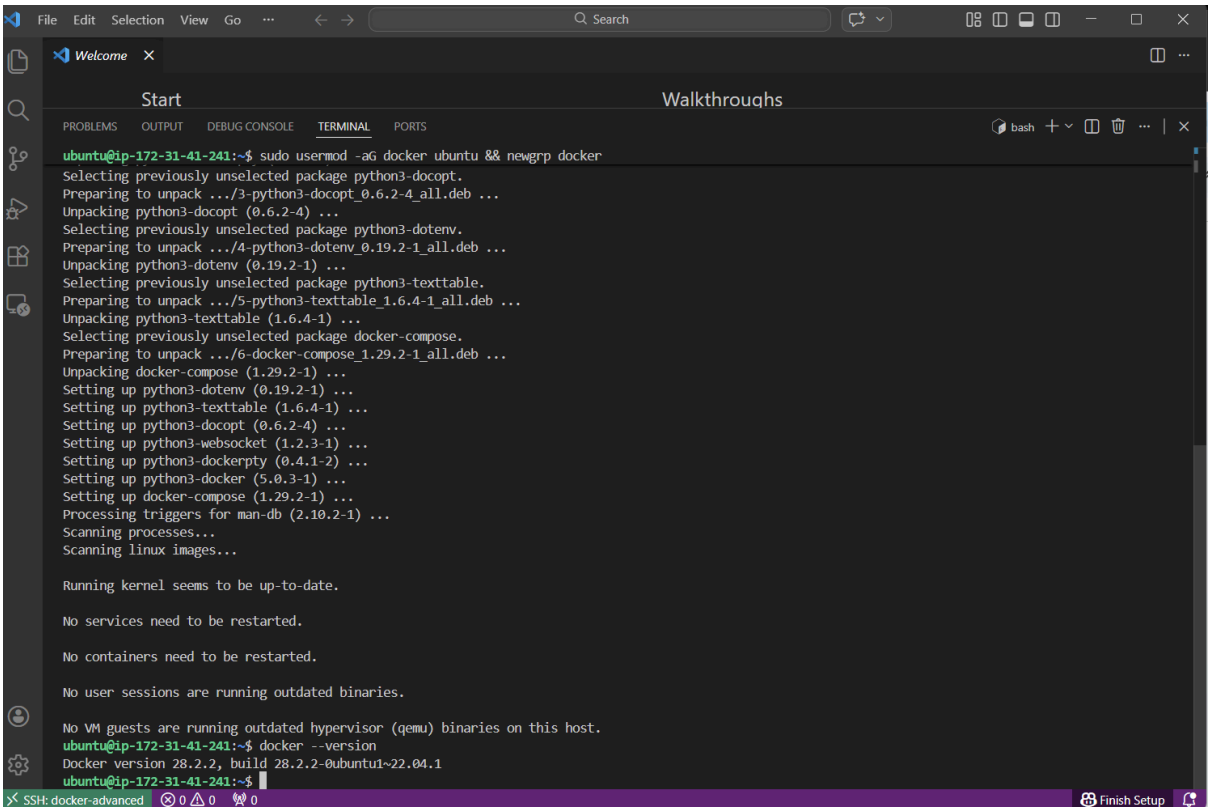
Create a custom docker image for nginx and deploy it using docker compose, where the volume bind mount should be at /var/opt/nginx location. Push the created custom docker image to your docker-hub.

I created an EC2 instance named **Docker-advanced** and connected to it via SSH using Visual Studio Code. After establishing the connection,



I installed all the required Docker prerequisite commands listed below.ties steps

Docker installation commands:

1.) sudo apt-get update && sudo apt-get install -y docker.io

2.) sudo apt install apt-transport-https ca-certificates curl software-properties-common -y curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add - sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu focal stable"

3.) sudo apt install apt-transport-https ca-certificates curl software-properties-common -y

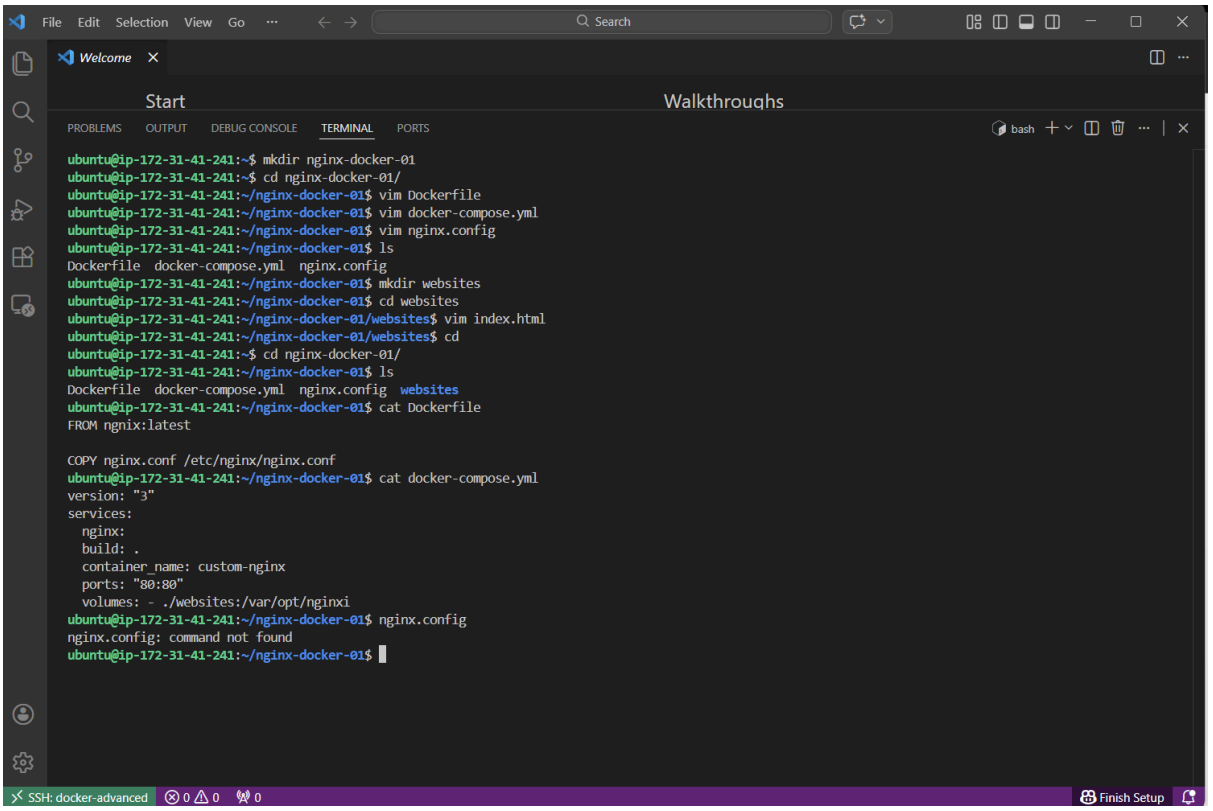
4.) sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu focal stable"

Permissions for docker:
sudo usermod -aG docker ubuntu && newgrp docker

Docker-compose installations

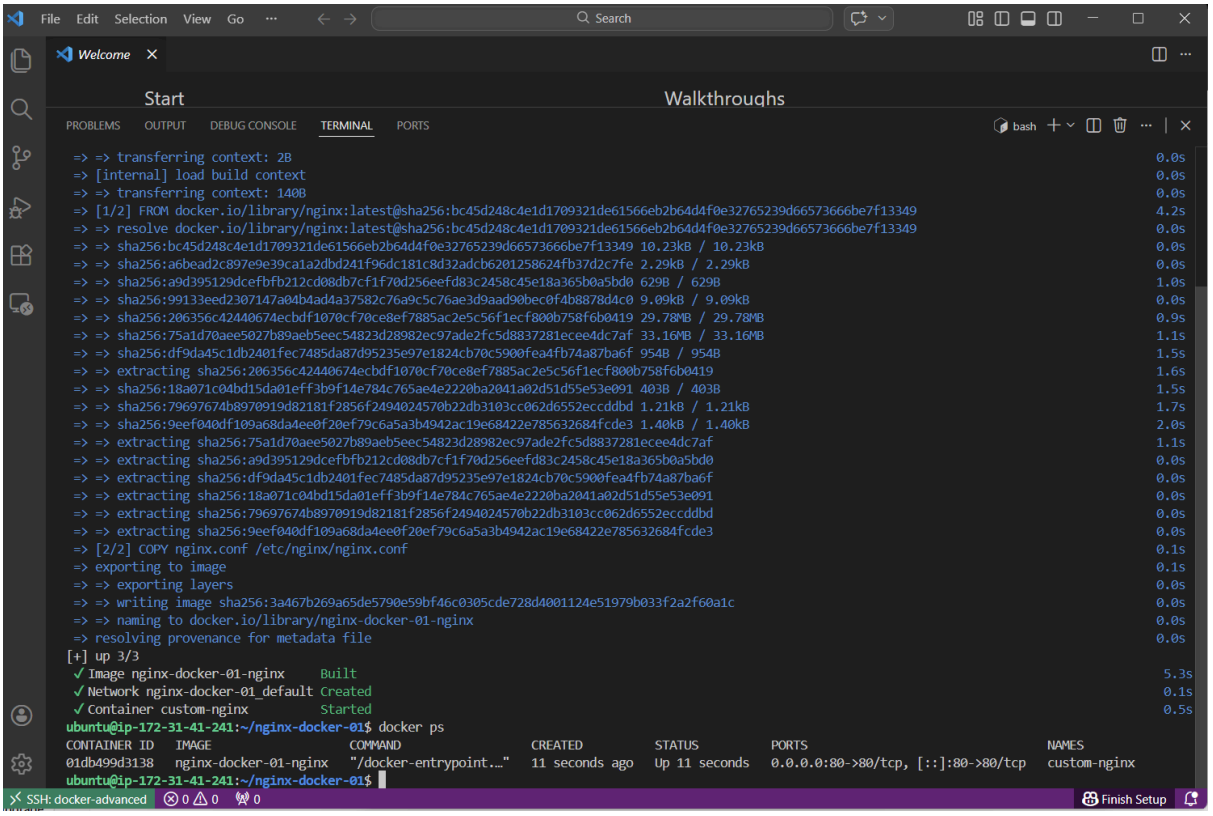
sudo apt install docker-compose -y

Next, I will create a folder named **nginx-docker-01** and navigate into it. Inside this folder, I'll set up the project structure, which will include a **Dockerfile**, a **docker-compose.yml** file, and an **Nginx configuration file**. Additionally, I'll create another folder called **website**, where I'll place an HTML file that will be used for deployment.

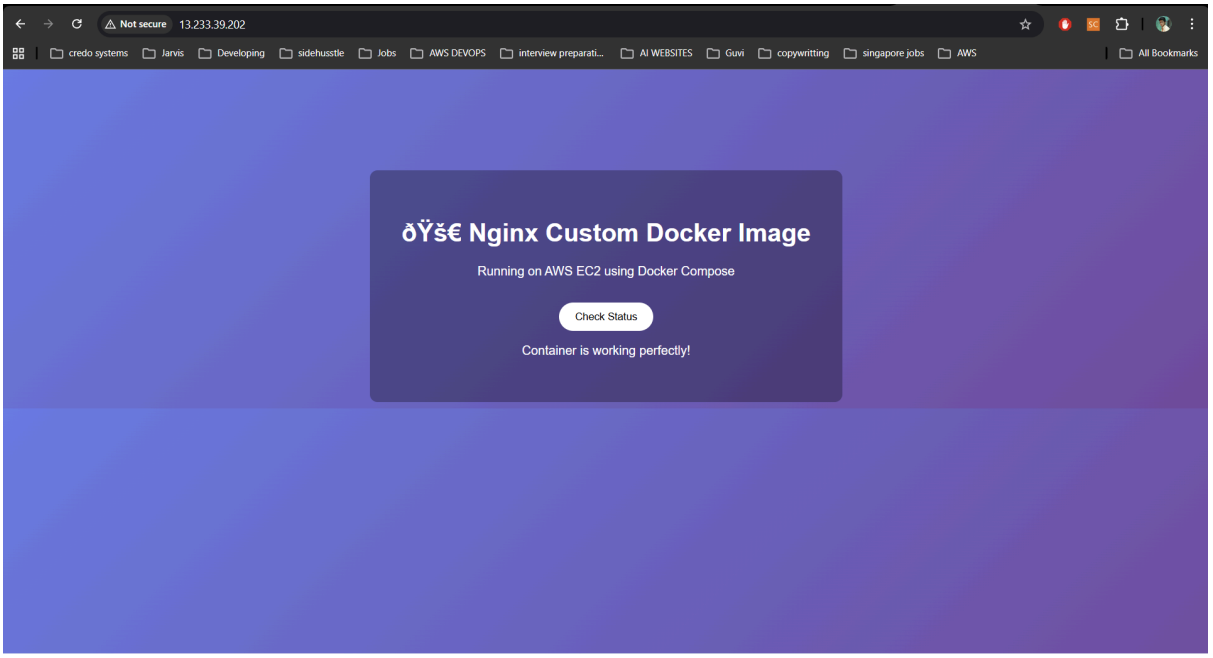


Next I will build a container and deploy the Nginx configuration. The bind mount to `/var/opt/nginx` is defined in the Docker Compose file, which

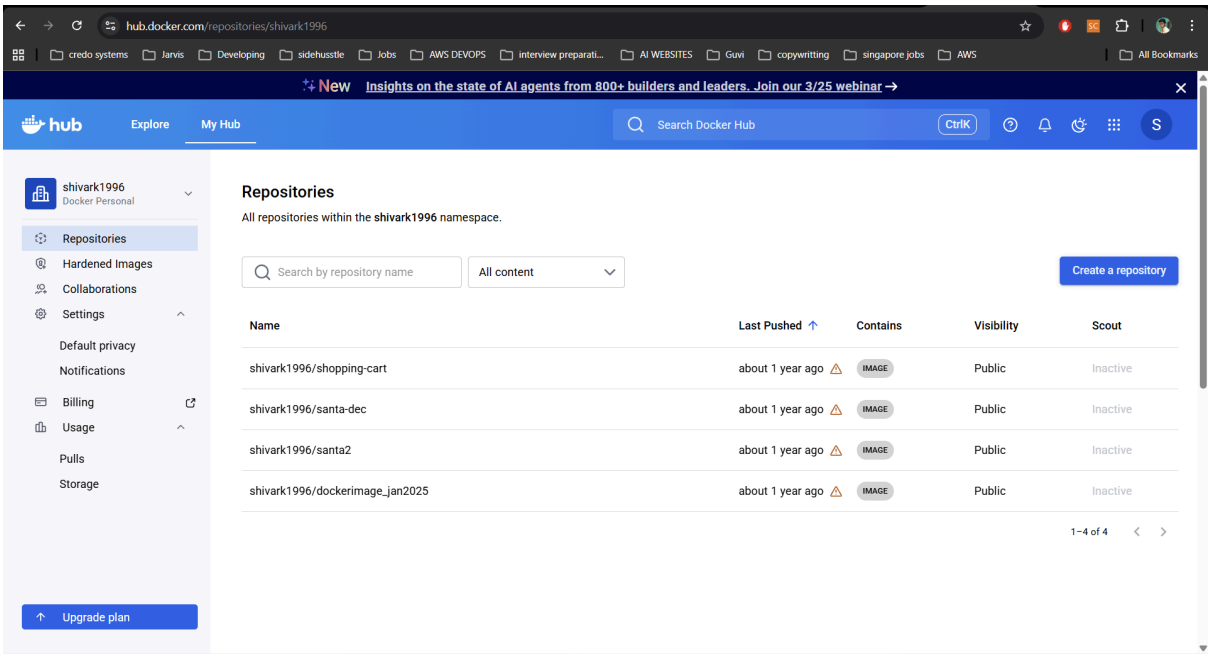
establishes the connection between the host and the container. This means that any files placed inside `data/index.html` on the host will automatically appear inside the container at `/var/opt/nginx/index.html`

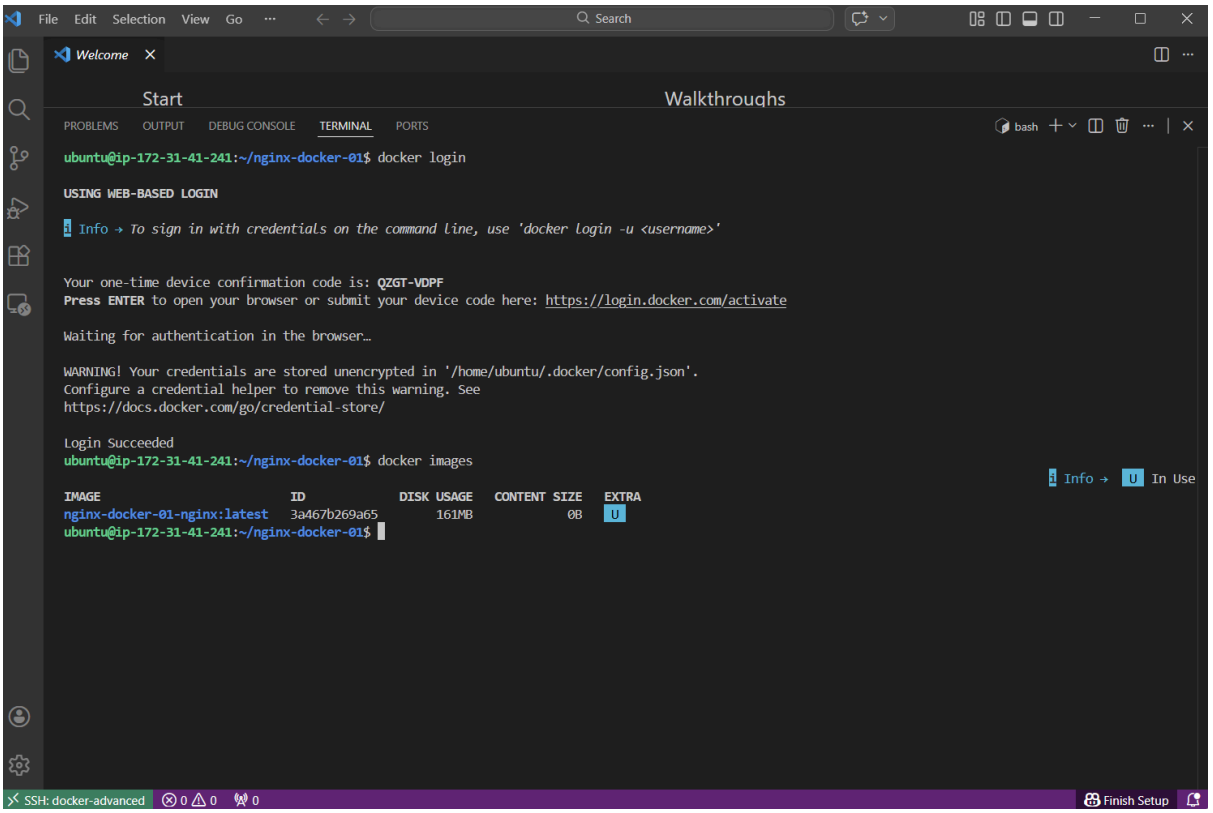


Perfect:) It works.

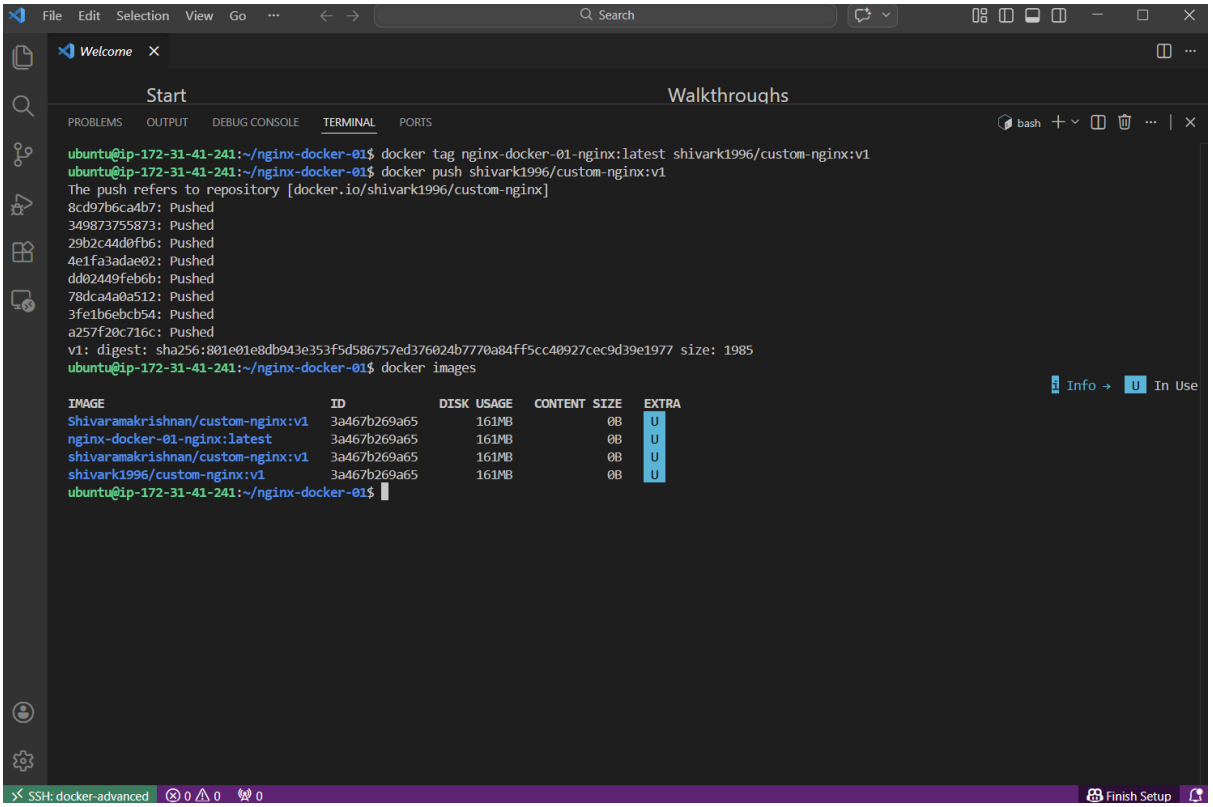


Next I will push my Nginx conf image to Docker hub I have already have an account in docker hub





docker tag nginx-docker-01-nginx:latest shivark1996/custom-nginx:v1
docker push shivark1996/custom-nginx:v1



Here is the Image I pushed from the server.

buildcloud

Build with
Docker Build Cloud

Accelerate image build times with access to cloud-based builders and shared cache.

Docker Build Cloud executes builds on optimally-dimensioned cloud infrastructure with dedicated per-organization isolation.

Get faster builds through shared caching across your team, native multi-platform support, and encrypted data transfer - all without managing infrastructure.
